Furlerboom - Proven In-Boom Furling Systems

Furling System	complete furling boom system

One of the first in-boom furling systems on the market, known for its proven, robust design and broad application range.

The Furlerboom is a high-quality in-boom furling system designed for safe, efficient and performance-oriented sail handling. It allows hoisting, reefing and furling of a fully battened mainsail directly from the cockpit, combining ease of use with uncompromised sail shape.

The system is operated electrically. Electric in-mandrel drive units are integrated inside the boom and positioned at the forward end of the boom for optimal weight distribution.

Furlerboom systems are designed and manufactured in Denmark and are used on a wide range of cruising and performance yachts worldwide.
