FS-9/S9

application	with double lashings
weight	67,50 kg
max. work load	30 t
compatible furling profiles	S9
L	280 mm

Swivels are tied to the halyards using a double lashing, to save weight and reduce the heeling moment.

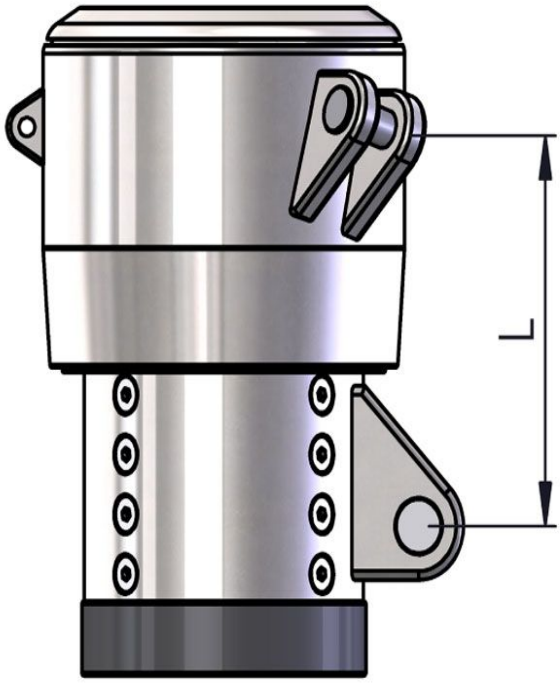

Our tried and tested halyard swivels for foresail furling systems with profiles are distinguished by their low friction, even when bearing heavy loads. This prevents the profile from becoming entangled when bearing heavy loads.

All halyard swivels are therefore built to be lightweight in order to save on weight aloft. Where the weight aloft plays a specific role, we also offer halyard swivels made from aluminium and titanium.

Swivels in size 9 are tied to the halyards using a double lashing. This method of attachment saves weight and reduces the tilting moments acting on the swivel and foil.

FS-9 with double lashing
